1 Introduction

This purpose of this document is to provide specifications for the tables and listings to be provided for Millendo Therapeutics Protocol ATR-101-301. Information regarding the study objectives and procedures can be found in the Protocol.

On August 12, 2019, Millendo Therapeutics elected to discontinue the ATR-101-301 study based on an analysis of the feasibility of patient recruitment and a reprioritization of resources. A total of 4 subjects entered the open-label dose-escalation period of the study, but no subjects entered the double-blind randomized withdrawal period prior to study discontinuation. The available data from subjects who participated in the study will be used for safety summaries, but no formal statistical analysis of safety data will be conducted. The efficacy parameter of 24-hour urinary free cortisol (24-hr UFC) will be summarized but formal statistical analysis will not be performed due to the limited data available.

All available data will be listed. All summaries will be based on observed values only.

1.1 Subject Disposition

Counts of subjects who screened, entered the open-label dose-escalation period (i.e. dosed), and entered the double-blind randomized withdrawal period (i.e. randomized), as well as counts and percentages of subjects who completed the study and who withdrew early from the study, with the reason for early withdrawal, will be presented in total.

1.2 Demographic and Baseline Characteristics

Descriptive summaries of demographic and baseline characteristics will be presented for all dosed subjects. Baseline measurements refer to the last measurement prior to the first dose of study drug.

Demographic and baseline characteristics include, but are not limited to: age at informed consent, sex, race, ethnicity, height at screening, baseline body weight, and baseline body mass index (BMI). Continuous variables (age, height, weight, BMI) will be summarized by subject count, mean, standard deviation, median, minimum, and maximum. Categorical variables (race, sex, ethnicity) will be summarized by the number and percentage of subjects in the corresponding categories.

1.3 24 Hour Urinary Free Cortisol

Descriptive summaries of 24-hr UFC will be presented for all dosed subjects by scheduled visit.

1.4 Pharmacokinetics

Plasma PK samples will be collected to determine the concentrations of nevanimibe HCl (ATR-101; hereafter, “nevanimibe”). Planned sampling time points are listed in the table below. No subjects entered the double-blind randomized withdrawal period, therefore PK samples are not available for R1 and R2.

Visit	Sampling Time Points (Morning Dose Only)
T1 (Day 1, 250 mg BID),	0 (within 30 min predose), 1 ($\pm$ 5 min), 2 ($\pm$ 10 min), 3 ($\pm$

Visit	Sampling Time Points (Morning Dose Only)
T2 (Day 15, 500 mg) BID, and T3 (Day 29, 1000 mg BID)	10 min) and 4 hr ($\pm$ 10 min)
Early Termination	0 hr

The exact time of each sample collection will be recorded. If the exact time (measured from dosing) is outside of the collection window for nominal time points, the corresponding concentration will be excluded from concentration versus time descriptive statistical summaries and plots, but will still be used in the calculations of PK parameter estimates.

1.4.1 Handling Missing Data or Concentration Below the Lower Limit of Quantification

Concentrations below the limit of quantitation (BLQ) before the first measurable concentration in a profile will be assigned a value of zero. A single BLQ value between measurable concentrations in a profile will be set to missing in the derivation of PK parameters, statistical analyses, and the individual subject plots. BLQ values that occur after the last measurable concentration will also be set to missing in the derivation of PK parameters and in the individual subject plots.

In cases of missing pre-dose at T1 visit, the missing concentrations will be assumed as zero. In cases of missing pre-dose on T2 or T3 visits, the minimum observed concentration during the dosing interval may be used as pre-dose concentration values. For other cases, the missing data will not be imputed.

1.4.2 Pharmacokinetic Parameters

The following PK parameters will be estimated at T1, T2, and T3 visits for nevanimibe as data permit and as appropriate.

PK Parameter	Definition
C _{max}	The maximum drug concentration determined directly from individual concentration-time data
T _{max}	The observed time to reach maximum concentration
AUC _{0-t}	The area under the concentration-time curve from time zero to the time of the last quantified concentration
AUC ₀₋₄	The area under the concentration-time curve from time zero to 4 h after dosing
λ_z	The terminal phase rate constant, estimated by linear regression through the terminal phase of the log concentration-time profile

PK Parameter	Definition
$t_{1/2}$	The terminal phase half-life, calculated as: $t_{1/2} = \ln(2) \div \lambda_z$
$AUC_{0-\infty}$	The area under the concentration versus time curve from time 0 to infinity (first dose only), calculated as $AUC_{0-t} + C_{last}/\lambda_z$
$AUC\%extrap$	Percentage of $AUC_{0-\infty}$ extrapolated, represented as $(1 - AUC_{0-t}/AUC_{0-\infty}) \times 100$

Plasma PK parameters will be calculated by standard non-compartmental analysis (NCA) for all dosed subjects with available data. The actual dosing and sampling time points will be used for evaluation of PK data. The linear up/log down method will be used in the computation of AUCs.

The λ_z will not be presented for subjects who do not exhibit a terminal elimination phase in their concentration-time profiles. In order to estimate terminal elimination rate constant, λ_z , linear regression of concentration in logarithm scale versus time will be performed using at least 3 data points. Uniform weighting will be selected to perform the regression analysis to estimate λ_z .

Generally, the constant λ_z will not be assigned if one of the following happens:

1. T_{max} is one of the 3 last data points,
2. The regression coefficient (R-squared) is less than 0.80,
3. The estimated elimination rate indicates a positive slope, or
4. The terminal elimination phase is not linear (as appears in a semi-logarithmic scale) based on visual inspection.

If the λ_z is not assigned, the values of associated PK parameters will not be calculated. In the cases where $AUC\%extrap$ exceeds 20%, the λ_z will be assigned but the λ_z and the corresponding λ_z -related PK parameters will be flagged and listed with an explanatory footnote.

1.4.3 Pharmacokinetic Summaries

Plasma concentrations of nevanimibe will be summarized by nevanimibe dose (250 mg, 500 mg, 1000 mg) by time point, including plots in linear and semi-log scales. If the exact time (measured from dosing) is outside the collection window for the scheduled time point, the corresponding concentration is excluded from the summary of that time point.

Individual concentrations at each nevanimibe dose level will be plotted in linear and semi-log scales.

PK parameters at each nevanimibe dose level will be summarized.

1.5 Adverse Events

Adverse events (AEs) will be coded and classified by system organ class and preferred term using the Medical Dictionary for Regulatory Activities (MedDRA) version 18.0. All AEs,

regardless of relationship to study drug, should be collected beginning from the time the subject signs the study consent until the last study visit or 30 days after the last dose of study drug, whichever is later. (Any SAE judged by the Investigator to be related to the study treatment should be reported to the Sponsor regardless of the length of time that has passed since study completion.) AEs in study subjects include any change in the subject's condition. This includes symptoms, physical findings, or clinical syndromes.

Treatment-emergent adverse events (TEAEs) will be defined as any adverse event beginning on or after the first dose date of study drug. AE subject counts will be provided for all dosed subjects in total and by treatment at AE onset (nevanimibe 250 mg, 500 mg, or 1000 mg).

An overview with counts of events and subjects will be provided for the incidence of AEs in the following categories.

- Any AE
- Any TEAE
- Maximum severity of TEAE
- Any study drug related TEAE
- Maximum severity of study drug related TEAE
- Any serious AE (SAE)
- AE leading to discontinuation from study drug

The incidence of TEAEs will be summarized by treatment at onset and in total by system organ class and preferred term. The same summaries will be done for study drug related TEAEs.

1.6 Clinical Safety Laboratory Evaluations

Shift tables from baseline to the worst post-dose value will be presented for ALT and AST (>1xULN to 3xULN, >3xULN to 5xULN, >5xULN) and alkaline phosphatase and total bilirubin (>1xULN to 1.5xULN, >1.5xULN to 2xULN, >2xULN).

ALT = Alanine Aminotransferase. AST = Aspartate Aminotransferase. ULN = upper limit of normal.

Baseline is defined as the last measurement prior to the first dose of study drug.

%=100*n/N, where n is the number of subjects in the specified category and N is the number of dosed subjects (N=4).

Number of tablets = number of tablets dispensed - number of tablets returned.

Days of exposure = last dose date of the specified dose level - first dose date of the specified dose level +1.

Compliance = 100*number of tablets/(days of exposure*2) for the 250 mg BID and 500 mg BID groups.

Compliance = 100*number of tablets/(days of exposure*4) for the 1000 mg BID group.

Program Name: XXXXXXXX.sas

Run Date: DDMMYYYY HH:MM

Clinical database last extracted: DDMMYYYY HH:MM

<< Programming Note: For the last dose level (i.e. 500 mg for subject 103-001 and 1000 mg for others), exposure = TRTEDT - TR03SDT + 1. For other dose levels, assume that the “last dose date of the specified dose level” is the day before the first dose date of the next dose level. For example for 250 mg (except 103-001), exposure = TR02SDT - TR01SDT. >>

TEAEs are defined as any AE beginning on or after the first dose date of study drug.
Onset dose is the subject's Nevanimibe dose level on the reported start date of the event.
For AEs starting prior to first dose of study drug, day = start date/end date - first dose of study drug.
Otherwise, day = start date/end date - first dose date OF THE ONSET DOSE LEVEL +1.
Duration = end date - start date + 1.
AEs are coded using MedDRA dictionary version 18.0.

<<Programming Note: Refer to EC.ECCAT="EXCEPTION DOSE" for the date of last dose prior to interruption and the date of restart. If any additional free text is mapped to SUPPAE (e.g. outcome sequelae or specify other action taken), then list it with the text of the parent field. >>
